Intentional Community Homes

2039 - 2040

Opt in to your future

by Charlotte & Nikita

MONSANTO

Intentional Communities.

We have designed homes to improve your emotional and physical health.

Monsanto offers its community members a chance to opt into their futures by growing custom-designed food genetically engineered for optimum health.

We care about the food you eat-so much so, we're designing it especially for you.

The cost of living is increasing exponentially year over year, making it increasingly hard to live at a commutable distance from work.

Bio Food. Intentional Design

At Monsanto, we know that food can protect from disease or cure illness. We know that in fortifying the food we eat with whole nutritional value is fortifying future generations. At Monsanto, we're designing the health of your future.

Bio Design is the process of genetically engineering food specific to your unique genetic makeup and lifestyle needs.

Genetics significantly increase your risk of contracting the same diseases your parents, siblings or grandparents have. By identifying those genes we can design food that inoculates you from those same diseases.

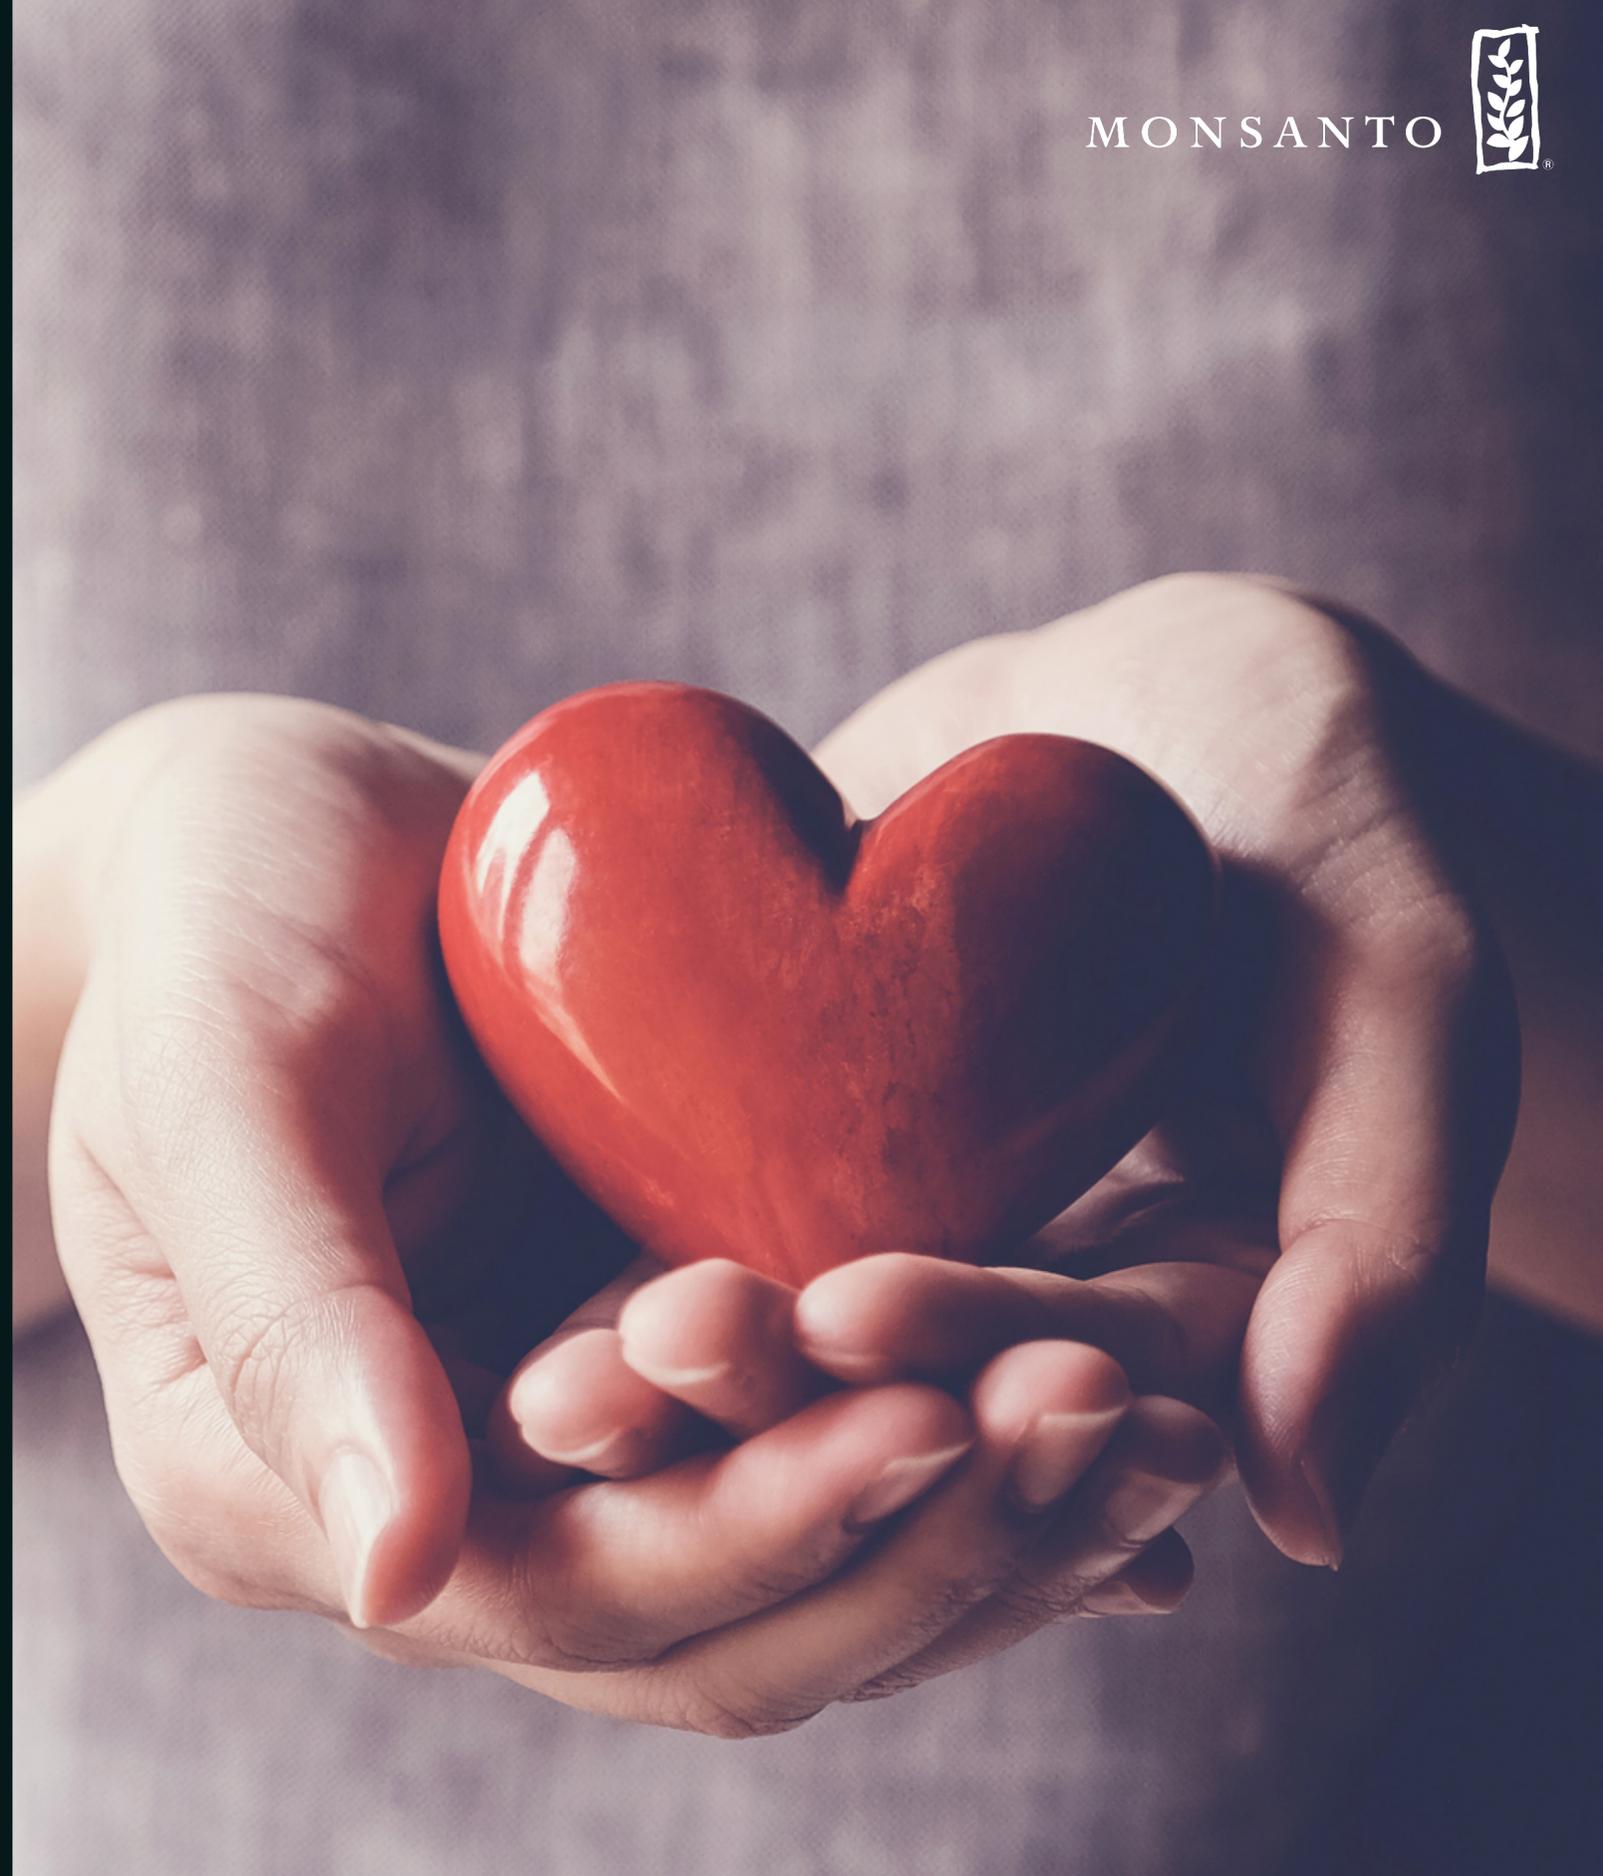

Bio Medicine. Intentional Design

We began designing the generation of biopharmaceutical plants to protect people against anti-cancer therapeutic agents, HIV, smallpox, and other potential biological warfare threats.

The leading causes of death in the United States are heart disease, diabetes, chronic respiratory illness, and Alzheimer's.

With biomedicine, these statistics are starting to turn around, with longer life expectancy, quality of life, and cure.

BioMedicine has made significant strides in mitigating genetic abnormalities in fetal development, obesity, asthma, and autism.

Why Intentional Communities?

We are the first generation to address global warming in a meaningful way. We have changed the detrimental impact of agriculture, including energy, land, and water-use.

Scientists now predict a reversal of global warming by the year 2050. But this requires us to think globally and come together as a community to change the way we think about our futures.

We believe in investing in your future and continue working towards a safe, healthy planet. As such, we are investing in Intentional Communities worldwide, for a better future designed by you.

Thinking Globally

Bioengineering is a science and scientists need data. When you opt into Monsanto, you help us find solutions to global problems such as malnutrition, disease and maternal-infant mortality.

You get a community of people who care, and a healthier future custom-tailored to your health care needs.

Monsanto and ©Intentional Community Homes ask you to sign our terms and conditions to opt into our data use agreement. We understand your data is private, which is why we do not sell or share your information outside of our organization.

At Monsanto, we know your data is precious; that's why we grow it with care.
